Week 2

This is very weird class the assignments are locked out and it appears it is a self-taught class. It appears there is some interaction with a team and we are giving lessons on what we learned and hopefully got it right. I'm fairly confused. Looking forward to meeting up with the team and getting a better understanding of the course.

I think I'll reach out to Brother Eddington to get a better understanding of the class.

Week 3

I talked to Brother Eddington and understand the class a bit better. I'm still concerned that it is really a self-study course, which is honestly what I've done with most of my programming knowledge.

I put together a Teams Group for our team and ran the zoom room this week. We've had a couple of meetings to get everyone together and are trying to figure out a good time to meet up with everyone.

We are having a bit of trouble getting all of the team members together and cannot get a hold of Vanessa.

I've been going over my topics and building a power point for my first class I'm not quite sure if we need to have a website to reference all of this or if we can just use separate programs to teach and show our knowledge. I think ill reach out to Brother Eddington next week. This is fairly simple stuff not much new to learn.

Week 4

Bad news Ginger dropped the class and Vanessa hasn't shown as well I guess we are down to three.

I talked to spencer we might add a few classes so we can cover everything.

The class on JavaScript was good unfortunately we only had one person show for the presentation. My final PowerPoint I updated at work and emailed home didn't send so I had to use what I had. I might try to give it again for a better video. It's been a rough week so I haven't been able to go over all of the lessons I'm going to be a bit behind but I think I can catch up next week.

Week 5

Waaa!!! It's week 5 already. I finished my other classes assignments and it's going to be a power session to catch up this weekend. I don't have a lesson tonight but I've been going over all the subjects and getting a general overview and a path forward. Had an impromptu meeting tonight to get our team together and brother Edington stepped in and gave us a better understanding of what is required. I also received a message from Vanessa tonight so I sent her my phone number to find out how to get her into the meetings.

Currently working on JSON Parse and Stringify lesson I'm learning a little bit more about it but it is still a pretty easy subject.

Week 6

This is horrible I've been sick since last week and have barley had the energy to get through the day.

I finished my parse and Stringify lesson and gave it in the class but again it was only myself and Spencer I've been trying to reach out to the other team members but getting little response. I've been building a website to keep my lessons in to show my fluency I'm using code pen to insert the code.

Week 7

This was a good week I have finished my code for my next class and I am working on my PowerPoint. I feel better and am starting to knock out coding on topics. I'm starting with the ones I know and I have checked out a couple of books from the library so I can read up on other topics when I have down time at work when I don't have access to a computer. Next week is going to be rough as much of my weekend will be filled with overtime work and a major group project is due in my other class. Would have been further ahead this week but decided to spend time with my family Sunday. I have priority with the family and my time schedule although close can handle it.

Once again Just Spencer and myself this week.

Week 8

Started early this week, most of my coding for my other class knocked out and I am focusing on my topics over the weekend. The end is coming quick and I need some time to review my topics when they are graded. It's coming down to the wire and I would rather have these done and reviewing but I can get this done.

The class meeting was a success this week all students were there its usually just Spencer and myself but Vanessa and Clayton showed up. I ran my original JS class with my better power point but I still need to address Associative arrays. Did it on spur of the moment the lack of prep showed. Not a good class.

Had some issues with the test and was a few minutes late for it. I did submit JSON, AJAX and Class Properties with JS. Ill cleanup lesson 1, 2, 5 and 10 on Sunday and get them out I also have most of my code on lesson 6 ready to go.

Week 9

Working through I'm submitting more fluencies this weekend my project in the other class took almost all of Saturday. I've done quite a bit over the week but I want to get most of my code in this weekend. I had some family issues on Thursday and missed the meeting with Spencer and Vanessa I met with Spencer later that night and met with Clayton on Saturday and gave my lesson on Manipulating Class properties with JavaScript. We went over some of his fluencies and discussed how deep we should go on the topic level. He is a bit behind so I suggested he should knock out as many as he could and submit them if their light, he could always add to them but if he is late with one it won't be good.

I'm still trying to figure out what type of app I want to build for the final project.

It was a good week.

Week 10

Week 11
